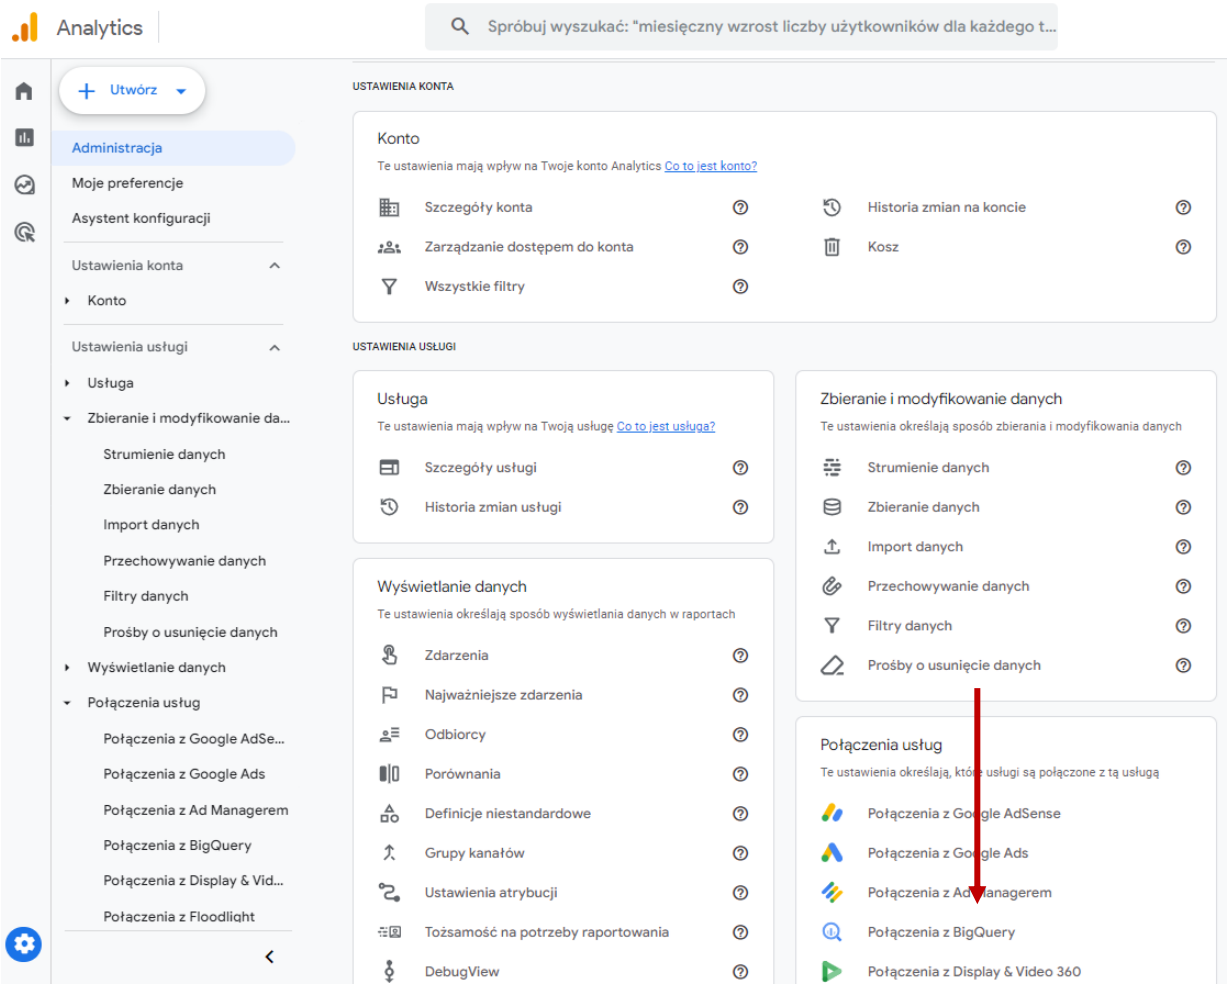
Core Web Vitals

Dashboard Instruction

In the following instructions, you will find a step-by-step explanation of how to link Google Analytics 4 together with Google Big Query. This is one of the easiest ways to retrieve data about the behaviour of your website when users access it.

Step 1:

Go to the administration panel in GA4 (located in the bottom left-hand corner of the page) and then go to Service Connections on the right-hand side and click on Big Query.



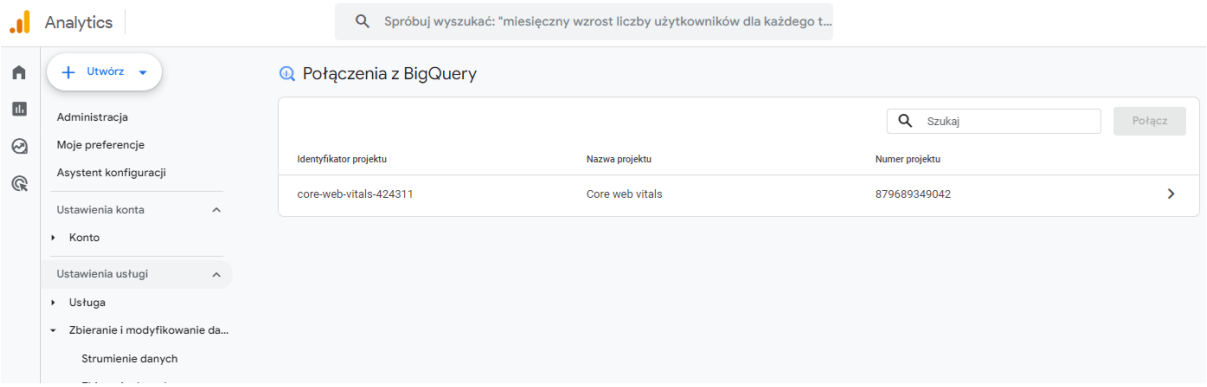
Step 2:

In this step, you should create instances of Big Query with free capacity, here is an explanation of how to do it properly:

https://www.youtube.com/watch?v=OWnKb6qii00&t=30s.

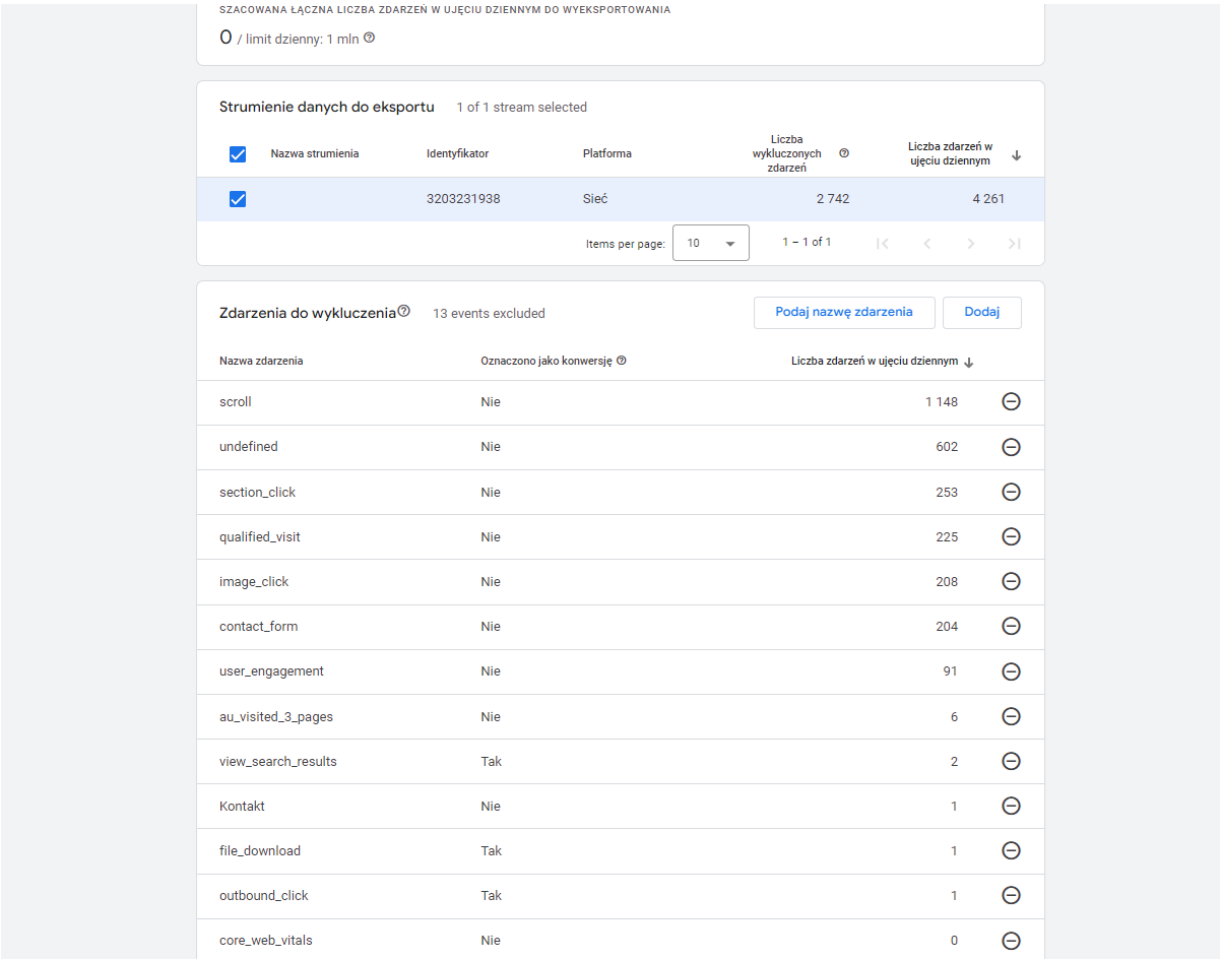
Step 3:

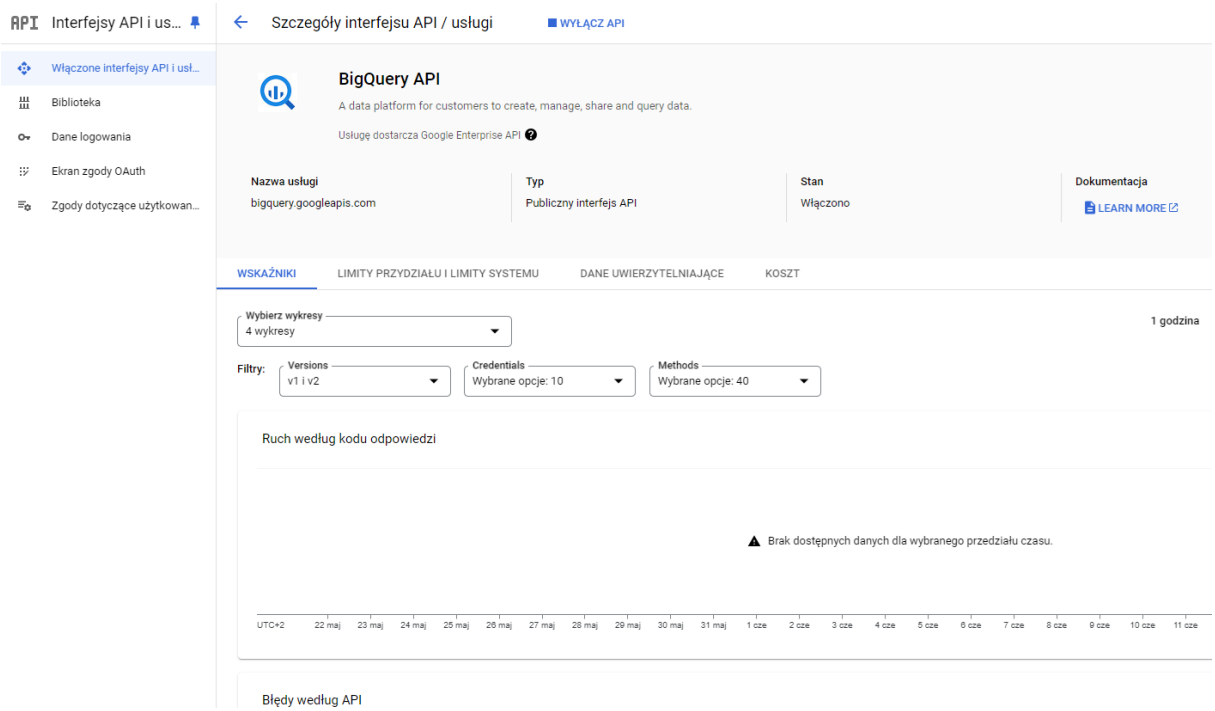
Go to the administration panel in GA4 (located in the bottom left-hand corner of the page) and then go to Service Connections on the right-hand side and click on Big Query.



Step 4:

To create the connection correctly you should choose which events you would like to download. Due to the amount of data (I recommend) that you only select events concerning: CLS, INP, LCP. Additional data, may, in the long term, result in the need to pay for data storage, which exposes you to unnecessary costs.



Step 5:


In order for the data to start downloading, remember to go into the Google Cloud Platform tab, search for the Big Query API, and finally turn it on. This is a key step as this enables the data to be downloaded from the GA4 service. In the screenshot below, the API is already enabled, but you will see a button at the top “Turn On”.
